lecture No 16.   (CSS Display property) → inline, Block, combo

Q = What is display property?
Q = How to Display tag on Window → div, a, h1 ----h5-, p

Display ⊙
        x   width →
        y   height →   ☆

Properties of Display.
    ① inline ② Block , ③ inline-block

(Start with block Elements) => Div, P, hi, Form, Section

        4-2   ① Always start with new lines.
    (Properties)
                     ② with EL to ER
   →
                     ③ custom Width height.

                     ④ custom margin/Patting.

(Box-Sizing = Border Box)

                                    → 102 +10 +10 = 122 px
Without borderbox: 100,
No M → U, Px   10
No P | 10   10 | 100, 102 +10 +10 = 122 px
                     10

Without borster box when you add Margin & padding it increase
the width the Size of the box content doesn't shrink in this
case.
  important
  (In case (box-sizing) this actual box will retain it's size.
   content   is getting shrink)

③ (Inline) → span, anchor,
    Properties   ① Always try to   come with same line
                      ② only take width as much content we have.
padding horizontal, No   ③ No width height supplied.
         Margin.

    Block   inline.

① new line   ① same line

② width left to Right   ② only content with height.

③ Custom Margin, width   ③ No applied, only work with
                               padding horizontal.

Conversion is Possible block | to inline & inline to Block.

(last) (inline - Block) => Combination of inline & Block.
            → inline
            → custom width / custom height.
